

Flow Fit

The best condition for your chemical reaction

FutureChemistry launches FlowFit!

FutureChemistry's mission is to transform the image of modern chemistry, with innovative yet straightforward products, which is further propagated with FlowFit: a powerful software package to screen parameter datasets for the corresponding optimal values. It handles extended reaction datasets to retrieve the optimal chemical parameters. When corresponding optimal values are determined, up scaling of the synthesis from milligram to ton-scale can commence.

An invaluable chemist's tool

Within the chemical industry, process development still requires significant R&D expenditure. For an important chemical product to be synthesised, optimal parameters for the chemical process have to be uncovered in order to maximize quality and reduce costs. Finding these optimal values is a time consuming process involving both chemical laboratory work and data handling. FlowFit is a critical ICT tool in transforming databanks of data into solid results.
